

Additional information for installation of cement tiles outdoors

Please use this information as a **compliment** along with Marrakech Design installation guide

Cement tiles will bleach with time due to the UV. Colorful tiles fade more than black/white/grey tiles. You can choose a colorful tile but you need to be aware of the above. There is no time frame for the bleaching process. We have noticed this is very individual depending on the colour and area where the tiles are installed.

Install the tiles with products that can withstand frost, applies to both fix and grout. Make sure that the foundation where the tiles are being installed has the right conditions.

Installation needs to be performed during the correct weather conditions:

Cooler 10 degrees

As warm as 20 degrees

You should re-seal the tiles 1–2 times a year. Be sure to clean the tiles properly before sealing. If there are hard stains that doesn't disappear when cleaning, please see Tips & Advice in our installation guide.

In some cases, it may happen that the surface layer of the tile burst. This can happen if the tiles are installed under open sky conditions and moisture penetrates the tile. To reduce the risk of this, you can cover the tiles during the winter months with a tarpaulin.
